                                                                                                                                                                                         The present invention specifically claims an element shown by: (A) a sequence having replaced 1-3 bases with the other base(s), which induces competence of endoplasmic reticulum. Also described are: (1) a DNA induces containing the above mentioned element, optionally further containing a ctivity with stress on endoplasmic reticulum. Also described are: (1) a DNA having promoter DNA; and (2) a vector containing the element can be used for the inhibition of growth and induction of apoptosis of cancer cells, and improvement of symptoms of autoimmune diseases and cystic fibrosis by inhibition of autoantibody formation.
                                                                                                                                                                                    Sequence 19 BP; 3 A; 5 C; 1 G; 1 T; 9 other;

                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                              The present invention specifically claims an element shown by: (A) a CC 19 bp base sequence, CCAATNNNNN NNNNCCAGG (ERSE); or (B) a modified base cC sequence having replaced 1-3 bases with the other base(s), which induces CC competence of endoplasmic reticulum. Also described are: (1) a bNA cC containing the above mentioned element, optionally further cC containing a promoter DNA; and (2) a vector containing the bNA. The element can be used for the element of symptoms of autoimmune diseases and cystic fibrosis by inhibition of cautomitody formation. AAZ25632 to AAZ225657 represent elements used in .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
The present invention specifically claims an element shown by: (A) a 19 bp base sequence, CCAATNNNNN NNNNCCACG (ERSE); or (B) a modified base sequence having replaced 1-3 bases with the other base(s), which induces competence of endoplasmic reticulum. Also described are: (1) a DNA having transcription inducing activity with stress on endoplasmic containing a promoter DNA; and (2) a vector containing the above mentioned element, optionally further optionally with the DNA. The element can be used for the inhibition of growth and induction of apoptosis of cancer cells, and improvement of symptoms of autoimmune diseases and cystic fibrosis by inhibition of
                                                                                                                                                                                                                                                useful for inhibition of growth and induction of apoptosis in cancer
                                                                                                                                                                                                                                                                 New control element for stress competence of endoplasmic reticulum
                                                                                                                                                                                                          Example 1; Fig 3; 25pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention specifically claims an element shown by: (A) a 19 bb base sequence, CCAATNUNNU NUNNCCACG (ERSE); or (B) a modified base sequence having replaced 1-3 bases with the other base(s), which induces competence of endoplasmic reticulum. Also described are: (1) a DNA reticulum containing the above mentioned element, optionally further containing a promoter DNA; and (2) a vector containing the element containing the behaving transcription of apoptosis of cancer cells, and improvement of symptoms of autoimmune diseases and cystic fibrosis by inhibition of autoantibody formation.                                                                                                                                                                    The present invention specifically claims an element shown by: (A) a 19 bp base sequence, CCAATNNNNN NNNNCCACG (ERSE); or (B) a modified base sequence having replaced 1-3 bases with the other base(s), which induces transcription with stress on endoplasmic reticulum used for stress competence of endoplasmic reticulum. Also described are: (1) a DNA competence of inducing activity with stress on endoplasmic reticulum containing the above mentioned element, optionally further containing a promoter DNA; and (2) a vector containing the element of optionally with the DNA. The element can be used for the inhibition of growth and induction of apoptosis of cancer cells, and improvement of symptoms of autoimmune diseases and cystic fibrosis by inhibition of autoantibody formation.                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention specifically claims an element shown by: (A) a 19 bp base sequence, CCAATINNNN NNNNCCACG (ERSE); or (B) a modified base sequence having replaced 1-3 bases with the other base(s), which induces transcription with stress on endoplasmic reticulum used for stress competence of endoplasmic reticulum. Also described are: (1) a DNA having transcription inducing activity with stress on endoplasmic reticulum containing the above mentioned element, optionally further containing a promoter DNA; and (2) a vector containing the element of optionally with the DNA. The element can be used for the inhibition of growth and induction of apoptosis of cancer cells, and improvement of symptoms of autoimmune diseases and cystic fibrosis by inhibition of autoantibody formation. AAZ25632 to AAZ25657 represent elements used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ25637 standard; DNA; 19 BP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
The present invention specifically claims an element shown by: (A) a 19 bb base sequence, CCAATNNNN NNNNCCACG (ERRE); or (B) a modified base sequence having replaced 1-3 bases with the other base(S), which induces transcription with stress on endoplasmic reticulum used for stress competence of endoplasmic reticulum. Also described are: (1) a DNA reticulum containing the above mentioned element, optionally further containing a promoter DNA; and (2) a vector containing the element
                                                                                                                                                               Example 1; Fig 3; 25pp; Japanese.
                                                                                                                                                                                                    New control element for stress competence of endoplasmic reticulum - useful for inhibition of growth and induction of apoptosis in cancer

                                                                                                                                                    An endoplasmic reticulum stress transcription factor (bZIP) an capable of regulating transcription inducing activity exhibited by an capable of regulating transcription inducing activity exhibited by an endoplasmic reticulum chaperone. The method comprises expressing an endoplasmic reticulum chaperone The method comprises expressing bzIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of chaperone gene. bZIP is useful for controlling the expression of chaperone gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12-NOV-1999;
                          endoplasmic reficulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reficulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the glucose regulating protein (GRP) promoter GRP78 contains an ERSE like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      13-NOV-1998;
